568437
Leptin receptor, splice form Ob-Ra - mouse
C; Species: Mus musculus (house mouse)
C; Accession: S68437
R; Lee, G.H.; Proenca, R.; Montez, J.M.; Carroll, K.M.; Darvishzadeh, J.G.; Lee, J.I.;

$74225
leptin receptor, isoform Ob-Rf - rat
C; Species: Rattus norvegicus (Norway rat)
C; Date: 29-Jan-1998 #sequence_revision 13-Feb-199
C; Accession: $74225
R; Wang, M.Y.; Zhou, Y.T.; Newgard, C.B.; Unger, R
FEBS Lett. 392, 87-90, 1996
A; Title: A novel leptin receptor isoform in rat.
A; Reference number: $74225; MUID:96368027
A; Accession: $74225
A; Molecule type: mRNA
A; Residues: 1-895 < WAN>
A; Experimental source: strain Sprague-Dawley; tis.

                                                                                                              which can be used to identify and purify ligands and activators.

An anti-WSX receptor antibody can be used as an agonist to activate the WSX receptor, leading to enhanced proliferation or differentiation of a cell expressing the WSX receptor. It can also contains to decrease body weight and/or fat-depot weight and/or food intake in an obese mammal. WSX receptor ligands can be used to enhance proliferation or differentiation of lymphoid, myeloid or contained blood cell lineages. This is useful when a mammal, caused blood cell levels, i.e. anaemia, caused by chemotherapy, radiation therapy or bone marrow transplantation therapy. It can also be used to treat, construction disease, cardiovascular diseases, cardiova

and anorexia
body weight. The invention also relates to a method of identifying therapeutic compounds for the treatment of a body weight disorder. The method involves contacting a cell that expresses a mammalian ObR protein, a JAK2 protein and a mammalian SOCS-1 protein with a test compound. The method is useful for identifying compounds which modulate ObR gene expression and gene product activity, which can be used as agents to control body weight particularly as therapeutic agents for treating body weight disorders, including obesity, cachexia and anorexiathe present sequence is ObR protein from human.
                                                                                                                                                                                                                                                                                          360
                                                                                                                                                                                                                                                                                                                                                                                    540

                                                                                                                                                                                                  9
                                                              This sequence represents the obesity (OB) receptor D protein. This sequence has one or more of the biological properties of naturally occurring OB receptor protein. The OB receptor proteins and OB receptor/OB protein complexes are used for the treatment of obesity, diabetes, high blood lipid levels and high cholesterol levels. The proteins may also be used to treat an individual for weight loss or weight maintenance required for purely cosmetic purposes.
                receptor(s) and related DNA - used to treat weight obesity, diabetes and high cholesterol or blood

The patent discloses obese receptor (ODR) proteins and nucleic acids encoding them. ODR protein participates in the regulation of mammalian body weight. The invention also relates to a method of identifying therapeutic compounds for the treatment of a body weight disorder. The method involves contacting a cell that expresses a mammalian ODR protein, a JAK2 protein and a mammalian SOCS-1 protein with a test compound. The method is useful for identifying compounds which modulate ober gene expression and gene product activity, which can be used as agents to control body weight particularly as therapeutic agents for treating body weight disorders, including obesity, cachexia and anorexia. The present sequence is human ODR protein mutant (Y1141F).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying compounds for treating body weight disorder, e.g. obesity, anorexia or cachexia, comprises contacting cell expressing mammalian Ob receptor protein, JAK2 protein and mammalian SOCS-1 protein with test

The invention provides a method for identifying modulators of binding of a phosphorylated leptin receptor with tyrosine-985 phosphorylated leptin receptor with tyrosine-985 phosphorylated leptin receptor or its phosphorylated fragment with protein PTP-1D or its fragment in the presence and absence of a candidate agent under conditions in which in the absence of the agent the binding of the phosphorylated leptin receptor or fragment with PTP-1D or its fragment can be detected; and (b) detecting the binding of the phosphorylated leptin receptor and PTP 1D; where an increase in binding detected in the presence of the agent, indicates that the agent enhances binding, and a decrease in binding in the presence of the agent indicates that the agent indicates that the agent is a binding inhibitor. Modulators of tyrosine-985-phosphorylated leptin receptor-dependent PTP-1D phosphorylation are useful as drugs in weight content of animals, particularly in mammals. Disorders that can be treated by PTP-1D modulators include conscity and its associated diseases, e.g. hypertension, heart disease and type II diabetes, and weight loss associated with cancer and AIDS. Additionally the agents identified may be useful in agriculture where body weight of domestic animals can be
                                                                                                                                                                                                                                                                                                                                                                                             Leptin; phosphorylated leptin receptor; tyrosine phosphatase 1D; PTP-1D; modulator; drug; weight loss; adiposity; hypertension;, heart disease; type II diabetes; cancer; AIDS: agriculture.
agents that modulate leptin activity

Human Ob receptor (ObR) (AAW19116) is a novel polypeptide that participates in the control of body weight and which is involved in signal transduction triggered by the binding of its natural ligand, Ob (leptin). It is a member of the class I cytokine receptor family. Its amino acid sequence was deduced from a foetal brain cDNA clone (AAT69592). The receptor corresponds to the long form mouse ObR (AAW19115). ObR proteins, peptides, antibodies, agonists and antagonists can be used in the diagnosis and treatment of body weight disorders such as obesity, cachexia and anorexia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        develop

Capra J.D., Nisonoff A.;
"Structural studies on induced antibodies with defined idiotypic specificities. VII. The complete amino acid sequence of the heavy chain variable region of anti-p-azophenylarsenate antibodies from A/J mice bearing a cross-reactive idiotype.";
J. Immunol. 123:279-284(1979).
-1- MISCELLANEOUS: ANTIBODY ISOLATED FROM TEN MICE WAS EXCLUSIVELY OF THE IGG1 SUBCLASS. THERE WAS NO HETEROGENEITY IN THE HEAVY CHAIN V REGION SEQUENCE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
